BACKGROUND

To better assess the water quality of a particular aquifer at a given point in time, an attempt was made during the project year to sample all project wells producing from a common aquifer in a narrow time frame. Also, to more conveniently and economically promulgate those data collected, these aquifer summaries will make up the project Triennial Summary Report.

Figure III-1 shows the geographic locations of the Evangeline Equivalent Aquifer System and the associated project wells, whereas Table III-1 lists the wells in the aquifer along with their total depths and the use made of produced waters and the date sampled.

These data show that in January, February, and in April of 2000, fifteen project wells were sampled which produce from the Evangeline Equivalent Aquifer System. Of these fifteen wells, six are classified as Domestic wells, five are classified as Public Supply wells, three are classified as Industrial wells, and one is classified as an Irrigation well. The wells are located in eleven parishes in southeast and south central Louisiana.

Well data for registered project water wells were obtained from the Louisiana Department of Transportation and Development's Water Well Registration Data file.

PROJECT FIELD AND ANALYTICAL PARAMETERS

The field parameters that are checked at each sampling site and the list of water quality parameters that are analyzed in the laboratory are shown in Table III-2. Those project inorganic (total metals) parameters analyzed in the laboratory are listed in Table III-3. These tables also show the field and analytical results determined for each analyte.

In addition to the analytical parameters mentioned above, a list of project analytical parameters that include three other categories of compounds (volatiles, semi-volatiles, and pesticides/PCB's) is included. Due to the large number of analytes in these three categories, tables were not prepared for each well. However, in order for the reader to be aware of the total list of analytes, Tables III-4, III-5, and III-6 were included in this summary. These tables list the project analytes along with their Practical Quantitation Limits (PQLs) used during processing.

DISCUSSION OF WATER QUALITY DATA

FEDERAL PRIMARY DRINKING WATER STANDARDS: Under the Federal Safe Drinking Water Act, EPA has established Primary Maximum Contaminant Levels (MCL) for pollutants that may pose a health risk in public drinking water. A Primary MCL is the highest level of a contaminant that EPA allows in public drinking water. MCLs ensure that drinking water does not pose either a short-term or long-term health risk. While not all wells sampled were public supply wells, this Office does use the MCLs as a benchmark for further evaluation.

Laboratory data show that no project well that was sampled during the Fiscal Year 2000 monitoring of the Evangeline Equivalent Aquifer System exceeded a Primary MCL.

Those project wells reporting turbidity levels of >1 NTU, do not exceed the MCL of 1.0, as this primary standard applies to surface water systems only.

FEDERAL SECONDARY DRINKING WATER STANDARDS: EPA has set secondary standards which are defined as non-enforceable taste, odor or appearance guidelines. Field and laboratory data contained in Tables III-2 and III-3 show that eight of the wells sampled in the Evangeline Equivalent Aquifer System exceeded the Secondary Maximum Contaminant Level (SMCL) for pH, three of the wells exceeded the SMCL for iron, and one well exceeded the SMCL for color.

pH (SMCL=6.5 – 8.5 standard units (S.U.)):

ST-532 – 9.20 S.U.	ST-6711Z – 9.06 S.U.
TA-286 – 6.31 S.U.	WBR-181 – 9.13 S.U.
PC-325 – 8.62 S.U.	AV-5304Z – 8.61 S.U.
EF-5045Z – 6.40 S.U.	SL-679 – 8.88 S.U.

Iron (SMCL=300 ppm):

WA-241 – 1,586 ppb	WA-5210Z – 574 ppb
SL-679 – 5,580 ppb, 8,517 ppb (duplicate)	

Color (SMCL=15 color units (PCU)):

ST-6711Z – 55 PCU

VOLATILE ORGANICS WHICH HAVE NO ESTABLISHED MCL: The following values were exhibited in project well WBR-181. The listed volatile organic compounds do not have MCLs established for them.

Chloroform – 2.6 ppb	Bromodichloromethane – 3.4 ppb
Dibromochloromethane – 4.5 ppb	Bromoform – 1.5 ppb

Since this well is an industrial well and since there are no primary MCLs established for these compounds, and that these compounds were detected in the low ppb range, the well was not resampled to confirm the presence of these compounds.

SELECTED WATER QUALITY MAPS: For the reader's convenience, maps showing the contoured values for pH, TDS, chloride, and iron are included in this summary report in Figures III-2 through III-5.

SUMMARY AND RECOMMENDATIONS

In summary, the data show that this aquifer is of good quality when considering short-term or long-term health risk guidelines. Laboratory data show that no project well that was sampled during the Fiscal Year 2000 monitoring of the Evangeline Equivalent Aquifer System exceeded a Primary MCL. The data show that this aquifer is also of good quality when considering taste, odor, or appearance guidelines.

It is recommended that the several project wells assigned to the Evangeline Equivalent Aquifer be resampled as planned, in approximately three years. In addition, several wells should be added to those currently sampled to increase the well density for this aquifer.
